Title	MY WALLET – A Full Stack Expense Tracking Application
Objective	1. To develop a secure and reliable expense tracking system 2. To enable users to manage income, expenses, and budgets efficiently 3. To provide visual financial insights using charts and statistics 4. To implement role-based authentication for users and administrators 5. To ensure data security and accuracy through modern authentication mechanisms

Abstract	Managing personal finances effectively is essential in today’s fast-paced digital world. Many individuals still rely on manual methods such as notebooks or spreadsheets to track income and expenses, which are time-consuming, error-prone, and insecure. “My Wallet” is a full-stack web-based expense tracking application designed to help users efficiently manage their financial activities. The system allows users to record daily income and expenses, categorize transactions, set budgets, track recurring payments, and visualize financial data using interactive dashboards and charts. The application also includes an administrator module that provides complete oversight of users, categories, and transactions, ensuring data integrity and system security. Built using modern technologies such as React.js, Spring Boot, JWT authentication, and MySQL, the system offers a secure, scalable, and user-friendly solution for personal financial management.
Project Architecture	The system follows a client-server architecture. • The frontend is developed using React.js for a responsive and interactive user interface. • The backend is implemented using Spring Boot with RESTful APIs. • JWT authentication ensures secure communication between client and server. • MySQL is used as the relational database for data storage.
Scope of work	The application is suitable for individuals and small organizations for managing daily financial activities. The system is scalable and can be enhanced in the future with mobile application support, banking API integration, advanced analytics, and AI-based financial recommendations.

Technologies used	Frontend: • React.js • CSS3 • Axios Backend: • Spring Boot • Spring Security • JWT Authentication Database: • MySQL Tools: • Node.js • Maven
Application	• User registration, login, and email verification • Secure authentication and authorization • Transaction management (income and expenses) • Budget tracking and recurring transactions • Interactive dashboards and statistical analysis • Admin panel for user, category, and transaction management
Project Timelines (Total:120 hours)	Time plan of the Project: 1. Abstract 2. ER Diagram and Database 3. Coding 4. Code Testing 5. Project Report
